

How to install Google Chrome Beta in Fedora 11 and Fedora 12 via yum

Submitted by [Richard](#) [1] on Sun, 02/21/2010 - 07:17

Configure Google rpm repository

Google's Linux packages are signed with a GNU Privacy Guard (GPG) key. You must install the public package signing key on your system to prevent warnings or errors when installing packages from the Google Linux software repositories. Download the key and then use rpm to install it.

Run these command as root:

```
wget https://dl-ssl.google.com/linux/linux_signing_key.pub
rpm --import linux_signing_key.pub
```

As root, add the following to a file called google.repo in /etc/yum.repos.d/:

```
[google]
name=Google - i386
baseurl=http://dl.google.com/linux/rpm/stable/i386
enabled=1
gpgcheck=1
gpgkey=https://dl-ssl.google.com/linux/linux_signing_key.pub
```

Install Google Chrome

Use yum to install google chrome
yum install google-chrome-beta
